

Create new Issue Picker fields

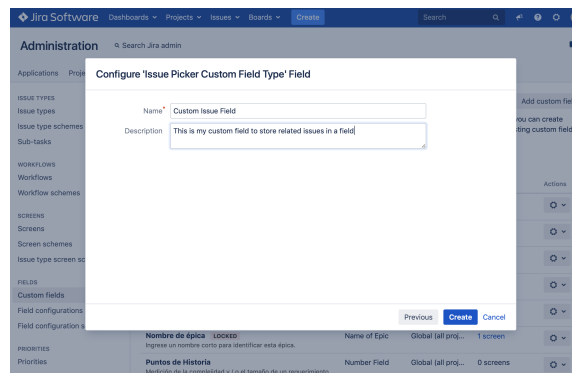

Go to
Administration
Issues -> Custom
fields

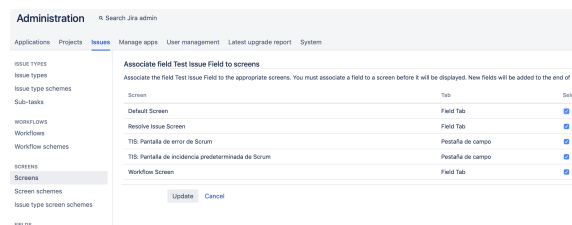

Create your new
custom field by
using the newly
added **Issue
Picker Custom
Field Type**

Choose the name
and description of
your brand new
custom field

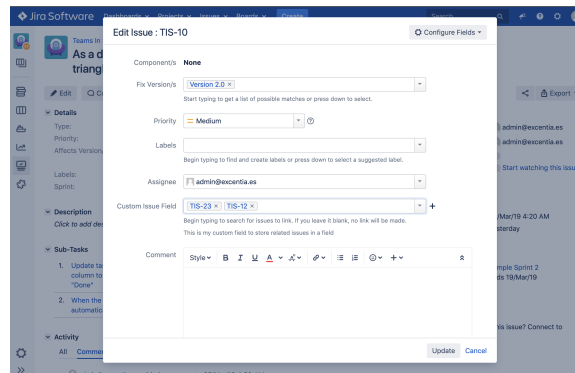

Associate your new
issue picker
custom field to the
desired screens

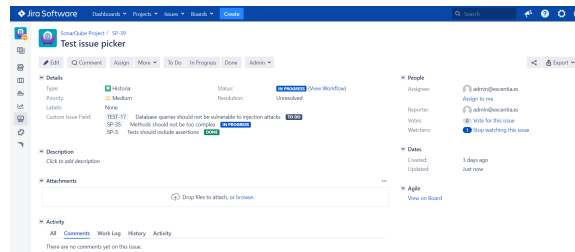

Once the screens
are associated with
your new issue
picker custom field
you will be able to

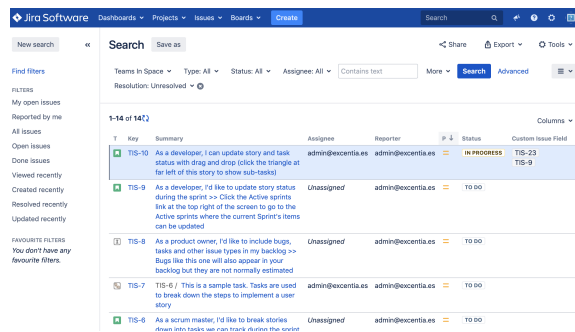

edit the field and
set the values for
the related issues

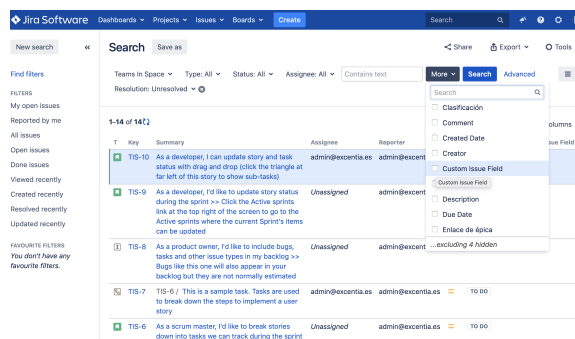

This is how you
can see the new
issue picker field in
Jira issue view

You can also add a
new column in
issue navigator to
display the issue
picker custom field

You can even use
the custom field
searcher to create
filters using the
newly created
issue picker
custom field

Just add the
criteria on that field
and complete the
form to filter the
results
