

TraceabilityX parameters

When you generate a traceability report or you use the traceability gadget, you will be able to setup different parameters.

The parameters are the same for both ways of using TraceabilityX for Jira app, except that the gadget will allow you to select a project.

Parameters Description

Select a project*:

(only when using the gadget)

This parameter allows you to select the project where the first level issues will be searched from.

First Level*:
Choose an issue type

You can filter your traceability report/gadget by selecting the first level issue type.

If you want to get all kind of issues, you should select the "wildcard" option *

For instance: if you want to know related task to any bug in your project, then you should select "Bug" issue type at first level.

Second Level*:
Choose an issue type

You can filter your traceability report/gadget by selecting the second level issue type.

Like the first level issue type, you can choose to select all the issue types using the wildcard.

For instance: if you want to know related task then you should select "Task" issue type at second level.

Relation*:
Choose an issue link type

You can also filter by relation between the first level issues and second level issues.

Just select the relation and the report will be generated only if the relation is the one you chose.

For instance: if you want to know all the related sub-task then you should select "Sub-task" as the issue link type / relation

Affected Version:
Choose a version

Filters by affected version.

Retrieves only the issues for the affected version.

Resolved Version:
Choose a version

Filters by fix version.

Retrieves only the issues for the fix version.

Component:
Choose a Component

Filters by component.

Retrieves only the issues for that component.

Filter:
Choose filter

Select a predefined user filter.

Retrieves only the issues returned for that filter.

Check it if you want to display first level issues without any link / relation

☐ First level issues without relations
Show first level issues without relations

☐ Second level issues without relations
Show second level issues without relations

Check it if you want to display second level issues without any link / relation

View **Show as a dependency matrix**
Select view type

Select the view for the generated report, available options are:

- Default: it displays a card view with issue types and relations
- Show as a table: it displays a table with all the issues and their relations
- Show as a dependency matrix: it displays a dependency matrix.

Default view:

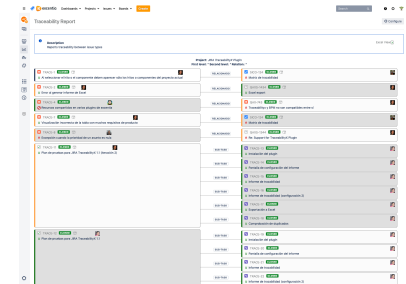

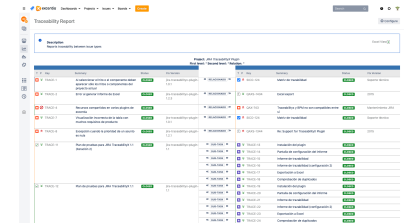

Table view:

Dependency matrix view:

Sorter **Ascending**
Select sorter type

Select sorter type for the generated report, available options are:

- Ascending: it displays a report in order **ascending** using issue key
- Descending: it displays a report in order **descending** using issue key
- None : it displays a report honoring the "order by" criteria defined in issue filter

Note: if there is no filter configured or filter does not have "order by" criteria, it displays report in default order.
