Create Jira Issues from SonarQube Issues

Since 1.7.1 version you can create SonarQube issues in Jira.

A button has been added in the row of the SonarQube rule to create them.

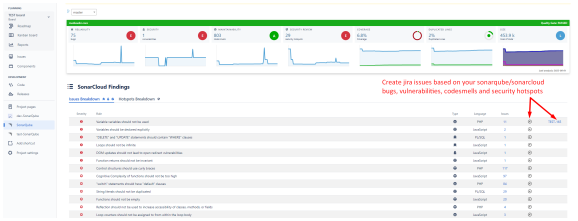

Issue will be created as follows:

- **Summary**: Name of the SonarQube rule.
- **Description**: A link to SonarQube issues. (If you have more than one project, a link is created only to projects that have issues)

If the SonarQube rules already have an associated issue, you will get a warning saying the issue cannot be created because it already exists.

If a new SonarQube analyis is launched and some issues have already been resolved and new ones have appeared, pressing the button will only create a new issues with the new ones.

When issue is created, a Jira issue link appears in the same row of SonarQube rule. If issue has been deleted or resolved, nothing appears.

> **Note**
>
> Since 2.3 the creation of issues with required fields is supported.
>
> In case the configured issue type has required fields, the create issue dialog will be opened to fill the required fields.
